

Next step

Based on our prototype test results, we will perform the following next steps:

- Evaluate the feedback and insights we've gained from our prototype test results.
- Identify if we want to add, remove, or improve on aspects of our design based on the results collected. For example:
 - Users felt that certain parts of the interface caused overwhelming cognitive load. We could find ways to reduce cognitive load by doing a hue, saturation and value study of our screen and lighten the number of screens or features that are in a single view.
 - Some users had trouble adding events to their calendar. Their instinct was to click on activities but our design only allows a drag and drop action. We will decide if this is something that needs to be changed or if we should stick with our current design.
- Redesign the features identified that we want to improve on.
